

Window fitting

Window fitting

TURN A DISTO INTO A WINDOW OF OPPORTUNITY

Modern day technology has well and truly passed the concept of tape measurement. With the advent of new technology we derive great benefits in time and cost saving. We can now perform tasks in a fraction of the time.

Window fitting would normally rely on the reading of tapes, measuring bands and telescopic rules. Imagine measuring up to 100 windows spaced over the frontages of, say, an apartment block with such devices. A tiresome, time consuming and sometimes dangerous task. Time saving, easier production planning and easier final installations are now possible!

DISTO D8 with Bluetooth and a palmtop computer allow you to retire back to the comfort of your office, and view the data on the PC monitor.

Using just a sketch and the DISTO D5 / DISTO D8, the window fitter can now safely record every frontage detail. This data can be edited so that it is conveniently available for production or for the final installation. Both DISTO has a special ending for the window fitter that help to measure from grooves. With the DISTO D5 / D8 you have an accuracy of ± 1.0 mm.

Any size or shape
can be measured
with the DISTO.
